

FTG-S12G-B54S-080

GBIC 1000Base-ZX, BiDi, 1550/1490nm, single-mode, 80km

Description

FTG-S12G-B54S-080 series GBIC transceiver can be used to setup a reliable, high speed serial data link over single-mode fiber. Maximum link span can reach 80km. This transceiver is based on WDM (BiDi) technology thus it is possible to send (TX:1550nm) and receive (RX:1490nm) data simultaneously in both directions over single strain of fiber. To establish working connection this transceiver should be matched with companion module (FTG-S12G-B45S-080). Module is fully compliant with GBIC MSA specifications and it is available in two hardware versions:

Model	Operating case temperature
FTG-S12G-B54S-080	0~70°C
FTG-S12G-B54S-080I	-40~85°C

Host device can access module internal EEPROM memory via I²C interface.

Transceiver can be prepared as compatible with: Cisco, HP, Netgear, Avaya, D-Link, Brocade, Extreme Networks, Huawei, Enterasys, 3Com, Alcatel-Lucent and other. To confirm compatibility please contact technical support before ordering.

Notes:

- TX Fault is open collector/drain output which should be pulled up externally with a 4.7KΩ-10KΩ resistor on the host board. When high, this output indicates a laser fault of some kind. Low indicates normal operation.
- TX Disable input is used to shut down the laser output per the state table below. It is pulled up to Vcc within the module.
Low (0 – 0.8V): Transmitter on
Open or High (2.0 – VccT): Transmitter Disabled
- Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up to Vcc with a 4.7KΩ-10KΩ resistor on the host board
Mod-Def 0 is grounded by the module to indicate that the module is present.
Mod-Def 1 is clock line of two wire serial interface for optional serial ID.
Mod-Def 2 is data line of two wire serial interface for optional serial ID.
- LOS (Loss of signal) - when high, this output indicates the received optical power is below the worst case receiver sensitivity (as defined by the standard in use). Low indicates normal operation.
- These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.
- VccR and VccT are the receiver and transmitter power supplies. They are defined as 5V±5% at the GBIC connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.
- TD-/+: These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.
