GBIC 1000Base-ZX, CWDM, single-mode, 28dB

Description

FTG-S12G-CxxQ-28B series GBIC transceiver can be used to establish multiple, high speed serial data links over single-mode fiber. Thanks to adoption of CWDM technology it is possible to send up to 18 separate data streams over single strain of fiber***. At least 28dB optical power budget is guaranteed. Transceivers are fully compliant with GBIC MSA specifications and are available in various hardware versions:

***eighteen pairs of CWDM modules and two pairs of optical multiplexer and demultiplexer devices will be required.

Notes:

- TX Fault is open collector/drain output which should be pulled up externally with a 4.7KΩ-10KΩ resistor on the host board. When high, this output indicates a laser fault of some kind. Low indicates normal operation.
- TX Disable input is used to shut down the laser output per the state table below. It is pulled up to Vcc within the module.
Low (0 – 0.8V): Transmitter on
Open or High (2.0 – VccT): Transmitter Disabled
- Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up to Vcc with a 4.7KΩ-10KΩ resistor on the host board
Mod-Def 0 is grounded by the module to indicate that the module is present.
Mod-Def 1 is clock line of two wire serial interface for optional serial ID.
Mod-Def 2 is data line of two wire serial interface for optional serial ID.
- LOS (Loss of signal) - when high, this output indicates the received optical power is below the worst case receiver sensitivity (as defined by the standard in use). Low indicates normal operation.
- These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.
- VccR and VccT are the receiver and transmitter power supplies. They are defined as 5V±5% at the GBIC connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.
- TD-/+: These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.
