### Description

FTS-C12G-10M SFP transceiver can be used to setup a reliable Gigabit Ethernet link over UTP cable (cat. 5e or higher). Maximum transmission distance can reach up to 100 meters. This module uses SerDes electrical interface on the host side. Host device can access module internal EEPROM and PHY configuration registers via I<sup>2</sup>C interface (address A0h for EEPROM, ACh for PHY registers). Module is fully compatible with SFP MSA (INF-8074i 1.0) and it is available in four versions:

Model	LOS Pin	Operating temperature range

#### Notes:

- TX Disable input is used to shut down the PHY. It is pulled up within the module with a 4.7 – 10K resistor.
  - Low (0 – 0.8V): PHY Enabled
  - Between (0.8V and 2V): Undefined
  - High (2.0 – VccT): PHY Disabled
  - Open : PHY Disabled
- Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up with a 4.7KΩ-10KΩ resistor on the host board to supply less than VccT+0.3V or VccR+0.3V.
  - Mod-Def 0 is grounded by the module to indicate that the module is present.
  - Mod-Def 1 is clock line of two wire serial interface for optional serial ID.
  - Mod-Def 2 is data line of two wire serial interface for optional serial ID.
- LOS (Loss of Signal) is not available and tied to ground in FTS-C12G-10M and FTS-C12G-10MI
- RD-/+ : These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.
- VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V±5% at the SFP connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.
- TD-/+ : These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.

### Notes:

1. Internally AC coupled and terminated to 100Ω differential load.

3. Mod\_Def1 and Mod\_Def2 must be pulled up externally with a 4.7KΩ-10KΩ resistor on the host board to V<sub>CC,T,R</sub>.
